The Future in Motion

Tackle winter with confidence.

Winter Tyres for Trucks, Buses
and Coaches

Ready for the harshest ride.

Temperatures are dropping? Then it's high time to switch to winter tyres - for your own safety and for optimal efficiency. But before you do, consider your driving needs and evaluate the requirements of your whole fleet.

Drive safely ✓

Do you drive on wet, snowy or icy roads? Continental Scandinavia winter tyres significantly improve vehicle handling and traction - in all cold weather conditions.

Think ahead ✓

In most European countries, M+S tyres or winter tyres are mandatory. Continental tyres meet - and even exceed - all regional regulatory standards.

Increase efficiency ✓

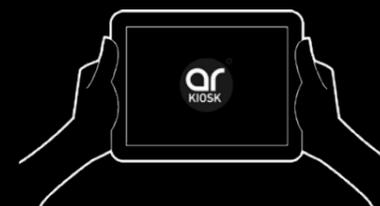

Benefit from innovation - Continental winter tyres deliver superior fuel economy, increased service life and reduced maintenance cost.

Take any route ✓

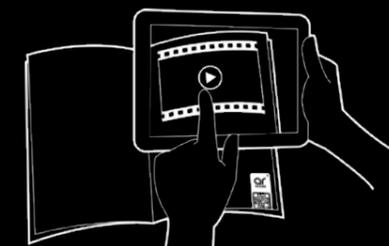

Purpose-built to get a firm grip on all winter driving needs. From long-distance motorway trips spanning several European roads to regional short-distance driving.

Augmented Reality (AR) content - find out more.

There's more than meets the eye! Experience embedded digital content on these pages using your smartphone or tablet. Here's how it works:

1. To access content, simply download the AR-Kiosk to your device.

2. Scan the AR code stamp on each page spread and experience AR directly on the screen.

Ride with the experts.

Purpose-built for professionals.

Continental has a history of innovation dating back more than 140 years and is renowned as a leading technology supplier to the automotive industry. We created our first winter truck tyre back in 1937. Since then, we have constantly re-invented the tyre and its accompanying services to create innovative solutions for professional tyre management. This dedication and a high level of in-house expertise is one of the many reasons why Continental tyres are one of the most efficient, safest choices for trucks, buses and coaches.

1937

Roads covered with ice or deep snow that can bring traffic to a halt are no longer an obstacle. Heavy vehicles equipped with Continental off-road tyres can now travel along wintry mountain passes with the same precision and safety as in summer.

1953

On 17 November 1953, test vehicles equipped with Continental M+S tyres cross over the St. Gotthard Pass at an altitude of 2112 metres. Continental thus successfully passes the first-ever winter tyre test on record.

1955

Continental M+S tyres for Commercial Vehicles. Based on innovations in the passenger car segment, the first M+S tyres are launched in the commercial vehicle sector, laying the foundation for a leading position of Continental in the field of winter truck tyres.

1960

Thanks to optimised tread patterns, winter tyres deliver up to 50% better grip on snow-covered roads and thus shorter braking distances compared with standard commercial vehicle tyres.

1970

Tyre construction shifts from cross-ply to radial carcasses, thus ensuring retreadability.

1980

Continental winter truck tyres are available in many dimensions. Thanks to a siping variation and a new kind of tyre contour (wider, flatter), the winter tyre's mileage performance and noise level in particular see a notable improvement.

1990

Introducing a new, clear-cut label for the Continental commercial vehicle product range: Scandinavia indicates that these winter tyres are especially well-suited for the toughest conditions. As well as tyres for driving axles and steering axles, the range also includes a winter tyre that is specially developed for trailers and trailing axles.

2000

A new generation of Scandinavia winter tyres is developed for use on steer, drive and trailer axles.

Ice and snow – let's go!

Winter road conditions will impact your driving. Increase your margin of safety with Continental winter tyres. Their special rubber compounds provide optimum traction once temperatures drop and stay flexible even in the coldest conditions. Also, the specific tread pattern enhances grip on snow and ice, which is especially important for unloaded trucks, as they are particularly affected by slippery slopes and wintry roads.

Influence of road conditions on braking distance, safety and performance.

Continental Scandinavia winter tyres – enhanced mobility on dry, wet, snowy and icy roads.

+ Traction performance

Hard to beat on the street.

M+S (Mud+Snow) marked tyres provide a tread pattern or structure that is designed to deliver performance that exceeds that of a standard tyre in snowy conditions. The M+S label is not subject to a defined test procedure.

Three-Peak Mountain Snowflake (3PMSF) tyres deliver winter performance that is legally certified. These tyres have to pass a test on a snow covered road and have at least 25% better traction than a standard reference tyre.

Continental Scandinavia winter tyres easily outperform M+S tyres and significantly exceed the requirements of the Three-Peak Mountain Snowflake symbol (3PMSF).

If you're driving through Europe in winter, you need to be prepared. The legal ramifications concerning winter tyres and snow chains vary significantly between European countries. To make sure your vehicle is always fitted with appropriate winter equipment, Continental compiles an annual overview of the various regional requirements. For further information, visit: <http://www.continental-truck-tires.com/winterregulations>

In a class of their own.

There are several options if you want to equip a truck, bus or coach for winter – but only one true choice.

The development of Continental Scandinavia winter tyres is based on many years of experience and practical knowledge gained by using these tyres in Scandinavian countries. They deliver maximum grip and traction on all winter road surfaces.

Continental Scandinavia vs. Standard M+S*

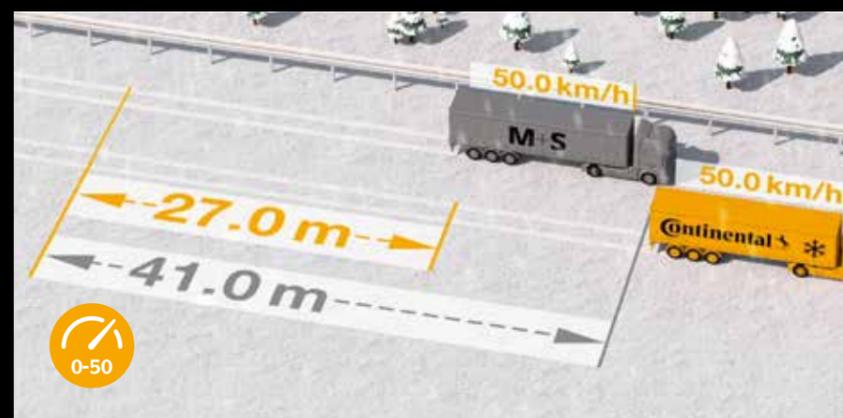

Shorter braking distance

Test scenario:
Full braking from 50 km/h to 0 km/h.

Get the best possible contact between your vehicle and the road surface – whether it is snowy, icy, wet or dry. To illustrate your Continental advantage, let's take this performance level to the streets.

Faster acceleration

Test scenario:
Accelerating to 50 km/h on a snowy road.

Always stay on the right track – with grip and confidence. The high traction provided by Continental winter tyres allows for agile driving with faster acceleration and less slip.

* Comparing an unloaded 12-ton truck, 5 axles, all wheels equipped with Continental Scandinavia winter tyres versus an identical unloaded truck equipped with standard M+S tyres.

Lockjaw with winter.

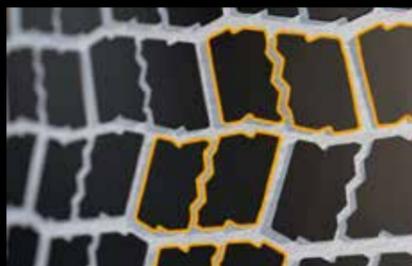

When winter really bites, these tyres bite back. Due to its advanced siping technology, design and specific tread pattern, the tyre literally lockjaws into snowy surfaces, without sacrificing durability for extended mileage.

Advanced siping technology

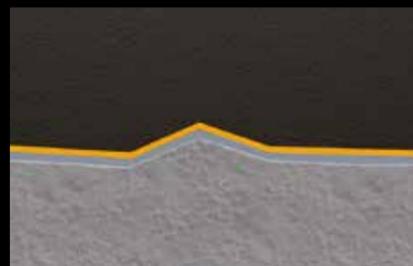

In winter, nothing is more important than traction. Continental winter tyres achieve this traction with an intelligent combination of different sipe types. Pocket sipes, 3D sipes and special traction sipes work together synergistically. Since the pocket sipes and 3D sipes in particular also maintain excellent tread stiffness, the mileage remains high and fuel consumption low.

Finely structured rib design

Continental winter tyres provide safety through optimum grip. High-density longitudinal and lateral grooves allow the tyre to firmly grip the ground surface. This effect is further enhanced by the high number of sipes.

Nano interlocking

On wintry roads, the aim is not just to avoid macroslip (spinning), but also microslip, i.e. the slipping of individual blocks. Continental compounds minimise this effect, because they keep the tyre highly flexible and adhesive while ensuring high wear resistance.

The all-year innovation – two tyres in one.

Your business benefits from proper winter tyres. All through the seasons.

Two tyres in one

The Continental two-phase tread is like having two tyres in one: The tread structure changes from a more open structure for safer grip to a closed tread, which is optimised for low rolling resistance with equally good adhesion to the road surface. Once the winter tread has worn away, you are left with a steer and trailer tyre with very good consumption figures for the summer season.

KM GÖRANSSON

“We have tried other winter tyres before but ever since we fitted Continental winter tyres about 8 years ago we have stuck with them. During winter time you need maximum traction such as in uphill starting situations. And Continental winter tyres never let you down!”

Christian Göransson, owner of KM Göransson, based in Sweden

BÖRJE JÖNSSON ÅKERI AB

“Wherever I have to go, I can rely on my Continental winter tyres. I remember one situation where the road was suddenly frozen, with ice on the ground and loose snow on top of it. While everyone else was stuck and had to fetch snow chains to get going again, I put my foot on the accelerator and just drove off. For me, this says it all.”

Mats, driver at Börje Jönsson Åkeri AB, based in Sweden

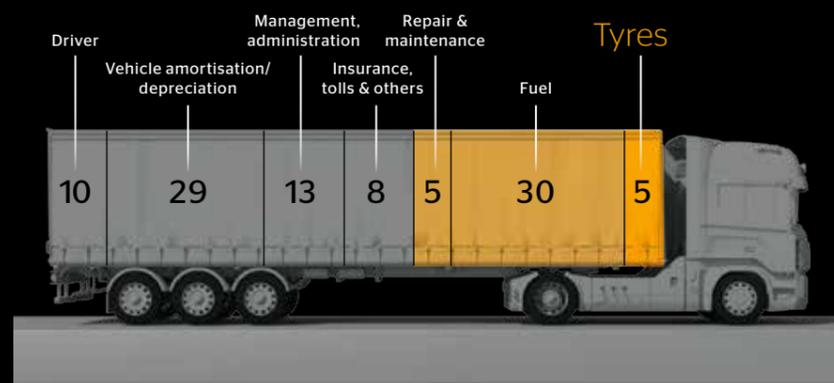

Winter tyre product range

Frost your cost.

Find out how your business benefits from proper winter tyres – all through the seasons.

Tyres typically have a share of about 5% of the seasonal budget for a transportation truck. However, this 5% share directly and indirectly affects many other variables, for instance, fuel consumption or maintenance downtimes. Together, these factors contribute a staggering 40% to total costs. It's safe to say: The slightly higher initial investment for Continental winter tyres not only pays for itself quickly, but also generates substantial savings in other areas.

Tyres account for 5%, but influence 40% of a fleet's operating costs.*

Steer your fleet clearly through all winter driving scenarios with Continental Scandinavia winter tyre innovations. And remember: While traction and safety always come first, the total cost of ownership never comes last.
